1. INTRODUCTION

1.1 Purpose

The purpose of this Software Requirements Specification (SRS) is to define the requirements of the proposed Course File Management System. The system is intended to simplify the process of collecting, managing and consolidating the information and documents required for preparing a Course File.

A course may be taught by multiple faculty members, particularly when different sections are handled by different instructors. During the semester, each faculty member prepares and maintains various course-related documents and information that may be required for the Course File. These materials are often maintained separately and may be submitted to the Course Coordinator at different times and in different formats.

The Course Coordinator then has to collect the submissions, check whether the required material has been provided, identify inappropriate or repeated information, and combine the contributions of different faculty members into a single Course File. Managing this process manually can become difficult as the number of faculty members and documents increases. Faculty members may also find it difficult to keep track of the documents that need to be maintained and submitted throughout the semester.

The proposed system will provide a centralized platform where faculty members can submit the required material as it is prepared during the semester. The submissions will be organized according to the relevant Course File sections, allowing the Course Coordinator to monitor and manage the information from a single platform instead of collecting it separately from different faculty members.

The system will also include an AI-assisted component to help process the submitted material. The AI component will assist in identifying the nature of the submitted content, checking its relevance to the selected Course File section, and combining similar or related information provided by different faculty members. This will help reduce unnecessary repetition while preparing the final Course File. The output generated by the AI component will remain subject to review and correction by the Course Coordinator.

This SRS defines the users, functions, interfaces, data requirements, constraints and quality requirements of the proposed system. It will serve as a common reference for the team during the design, development and testing of the Course File Management System.

1.2 Scope

The Course File Management System will be developed as a centralized web-based system for managing the preparation of Course Files for courses that involve multiple faculty members or sections.

The system will support the management of Course File-related material throughout the semester rather than limiting the submission process to the end of the course. Faculty members will be able to access their assigned courses or sections and submit the relevant documents and information under predefined Course File categories.

The system will distinguish between information that is common to the entire course and information that needs to be provided by individual faculty members. Common course-level information that is already available to the Course Coordinator, such as course details, course description, course outcomes, programme outcomes, programme-specific outcomes, CO-PO mapping and syllabus, does not need to be repeatedly submitted by individual faculty members. The system will therefore focus primarily on managing the course- and section-specific material that needs to be collected from faculty members during the semester.

The system will provide different levels of access based on the responsibilities of the users. The Administrator will manage users, courses, sections and faculty assignments. Faculty members will submit and manage the material related to their assigned courses or sections. The Course Coordinator will monitor the submissions, check their completeness and relevance, review the processed information and consolidate it into the final Course File.

The core scope of the system includes:

- User authentication and role-based access.
- Course, section and faculty assignment management.
- Predefined Course File categories for faculty submissions.
- Submission and management of documents throughout the semester.
- Organization of submitted material according to Course File sections.
- Checking whether the required material has been submitted.
- Checking whether a submitted file is appropriate for the selected category.
- Identification of repeated or similar information submitted by different faculty members.
- AI-assisted processing of submitted documents and information.
- AI-assisted consolidation and summarization of related information.
- Review and correction of AI-generated results by the Course Coordinator.

- Consolidation of faculty submissions into a single Course File.
- Editing and finalization of the consolidated Course File.
- Generation of the final Course File in the required format.

The system will focus specifically on Course File Management and will not replace existing institutional systems such as an ERP or Learning Management System. It will also not independently determine whether the academic information submitted by a faculty member is factually correct. The Course Coordinator will remain responsible for reviewing the final information before the Course File is completed.

Advanced features such as graphical summaries, detailed analytics, automated academic analysis and recommendation systems may be considered as future extensions. These features are not part of the core system requirements at the current stage.

Yes. If this is the **format/style your reference SRS uses**, then we should follow the same structure rather than making our section look completely different.

For your project, I recommend separating **Definitions** and **Abbreviations** exactly like the reference.

1.3 Definitions, Abbreviations and Acronyms

Definitions

Table 1 gives the explanation of the most commonly used terms in this SRS document.

Table 1: Definitions for most commonly used terms

S.No.	Term	Definition
1	**Course File**	A structured collection of course-related information and documents maintained for a course during an academic semester.

2	**Course Coordinator**	The faculty member responsible for coordinating a course and consolidating the required Course File material submitted by different faculty members.
3	**Faculty Submission**	A document uploaded by a faculty member under a specified Course File section.
4	**Course File Section**	A predefined category of the Course File under which the required document or information is submitted.
5	**Document Validation**	The process of checking whether an uploaded document is appropriate for the Course File section selected by the faculty member.
6	**Document Version**	A particular version of a document submitted or updated by a faculty member before the submission is locked.
7	**Content Consolidation**	The process of combining related information submitted by multiple faculty members into a single coherent representation while avoiding unnecessary repetition.
8	**AI-Assisted Processing**	The use of artificial intelligence to analyse submitted documents and assist in identifying, processing and consolidating relevant information.

9	**Submission Locking**	The process by which a faculty submission is made uneditable after the deadline defined by the Course Coordinator.
10	**Final Course File**	The consolidated and reviewed Course File generated from the common course information and relevant faculty submissions.

Abbreviations

Table 2 gives the full forms of the most commonly used abbreviations in this SRS document.

Table 2: Full forms of most commonly used abbreviations

S.No.	Abbreviation	Full Form
1	**SRS**	Software Requirements Specification
2	**AI**	Artificial Intelligence
3	**LLM**	Large Language Model
4	**FR**	Functional Requirement

5	**PR**	Performance Requirement
6	**ADM**	Administrator
7	**FAC**	Faculty
8	**CC**	Course Coordinator
9	**CO**	Course Outcome
10	**PO**	Programme Outcome

1.4 References

The following references were used to understand the Course File structure, gather system requirements and prepare this Software Requirements Specification.

[1]. Course File Template provided by the course faculty. Institutional template defining the structure and sections of the Course File to be maintained for a course.

[2]. Stakeholder Interview with Faculty Member and Course Coordinator. Information gathered through discussions with teaching faculty and the Course Coordinator regarding the existing Course File preparation process, document submission practices and difficulties faced during consolidation.

[3]. Software Requirements Specification (SRS) Template provided for the course. Reference document used for structuring the Software Requirements Specification and defining the required sections for the project.

[4]. Course File Management System – Project Phase 1 Documentation. Initial project documentation describing the identified problem, proposed system and planned approach for managing and consolidating Course File submissions.

1.5 Overview

This Software Requirements Specification describes the requirements of the Course File Management System and provides a common reference for understanding the system before its design and implementation.

The first chapter introduces the project, its purpose and its scope. The next chapter provides an overall description of the proposed system, including its relationship with the existing Course File preparation process, its major functions, its users, and the assumptions and constraints under which it will operate.

The following chapter defines the detailed requirements of the system. It describes the expected system behaviour, user interactions, interfaces, data requirements, performance expectations and quality requirements. The role of the AI-assisted component in processing and consolidating faculty submissions is also described as part of the relevant system requirements.

The later sections document the requirements gathered from stakeholders, their prioritization and their relationship with the identified problem. The document also includes the change history and approval information required for the SRS.

The requirements defined in this document will serve as the basis for the subsequent design, development and testing of the Course File Management System.

2. OVERALL DESCRIPTION

The Course File Management System is a web-based system designed to support the preparation and management of a Course File when a course is handled by multiple faculty members or sections. The system provides a common platform for faculty members to maintain their course-related documents during the semester and for the Course Coordinator to monitor, organize and consolidate these submissions.

The system is intended to improve the existing document management process without changing the academic responsibilities of the faculty members or Course Coordinator. Faculty members will continue to provide the information and documents related to their teaching responsibilities, while the Course Coordinator will remain responsible for reviewing and finalizing the Course File.

The following sections describe the system from a broader perspective, including how it fits into the existing process, what functions it is expected to provide, who will use it, and the conditions under which it will operate.

2.1 Product Perspective

The Course File Management System will operate as a centralized web-based platform for managing the material required to prepare a Course File. It will support the process from the point where faculty members are assigned to a course or section until the relevant submissions are organized and combined into the final Course File.

The system will begin with the basic course setup. The Administrator will manage the users, courses, sections and faculty assignments required for the system. The Course Coordinator will maintain the common course-level information that is already available for the course. This avoids requiring individual faculty members to repeatedly provide the same information.

During the semester, faculty members will be able to access their assigned course or section and submit the required material under predefined Course File categories. This will allow the documents to be maintained as they are created instead of requiring faculty members to collect everything at the end of the semester.

Once a submission is made, the system will associate it with the relevant course, section, faculty member and Course File category. The system will keep track of the required submissions so that the Course Coordinator can identify what has already been submitted and what is still pending.

The system will also assist in checking the submitted material. It will identify whether the expected material has been submitted and may flag a submission when the uploaded content appears unsuitable for the selected category. For example, if a faculty member uploads a document containing attendance information under a category that requires information about weak students or Course Outcome-related observations, the system should be able to flag the submission for review.

The AI-assisted component will further process the submitted material. It will help identify relevant content, recognize similar or repeated information contributed by different faculty members and combine related information into a concise form. The purpose is to reduce unnecessary repetition when contributions from several faculty members are brought together. The Course Coordinator will be able to review the AI-generated result and make corrections before it becomes part of the final Course File.

The overall relationship between the major parts of the system can be represented as:

The system is therefore intended to support the existing Course File preparation process rather than replace the academic responsibilities of the faculty members or Course Coordinator.

2.2 Product Functions

The major functions of the Course File Management System are listed below. These describe the main capabilities of the system at a high level. The detailed behaviour and requirements associated with these functions will be specified in the following chapter.

User and Access Management:

The system will provide secure access to authorized users and will provide different permissions according to their roles.

Course and Faculty Management:

The system will allow authorized users to manage courses, sections and the faculty members assigned to them.

Course Information Management:

The system will allow the Course Coordinator to maintain common information associated with a course so that the same information does not have to be repeatedly collected from individual faculty members.

Faculty Document Submission:

The system will allow faculty members to submit the documents and information required from them under predefined Course File categories. Faculty members will be able to make these submissions throughout the semester.

Document Organization:

The system will organize submitted material according to the relevant course, section, faculty member and Course File category so that the Course Coordinator can access the material in a structured manner.

Submission Completeness Checking:

The system will keep track of the required submissions and indicate which expected material has been submitted and which is still pending.

Submission Validation:

The system will assist in checking whether the material submitted under a particular category appears appropriate for that requirement. Potentially incorrect submissions will be flagged for review rather than being automatically rejected.

Course File Section Mapping:

The system will associate submitted documents and information with the appropriate section of the Course File. Where AI assistance is used, the system may suggest the appropriate section for a submission.

AI-Assisted Content Consolidation:

The system will use an AI-assisted component to process information submitted by different faculty members. It will help identify related or repeated information and consolidate it into a concise representation suitable for the Course File.

Course File Review and Editing:

The Course Coordinator will be able to review the organized and AI-processed information and make changes wherever required before finalizing the Course File.

Course File Generation:

The system will combine the approved information and submissions into the required Course File structure and provide the final output in the format decided for the project.

2.3 User Characteristics

The system will primarily be used by the Administrator, Faculty and Course Coordinator. Their responsibilities within the system are different, and the system will provide access according to these responsibilities.

Administrator:

The Administrator will be responsible for the basic setup and management of the system. This includes managing users, courses, sections and faculty assignments. The Administrator will not be responsible for reviewing the academic content submitted for a Course File unless such access is specifically assigned.

Faculty:

Faculty members will use the system to manage and submit the material associated with their assigned course or section. Their main interaction with the system will involve selecting the appropriate Course File category, uploading or entering the required material and maintaining their submissions throughout the semester.

The system should therefore provide a simple and clear interface for faculty members, allowing them to identify what needs to be submitted without requiring them to understand the internal processing performed by the system.

Course Coordinator:

The Course Coordinator will be the primary user responsible for managing the overall Course File. The Coordinator will be able to view the submissions made by different faculty members, monitor their completion status, review potentially incorrect submissions and examine the information consolidated by the system.

The Course Coordinator will also be responsible for reviewing the AI-assisted output and making any required corrections before the final Course File is generated. The final decision regarding the information included in the Course File will remain with the Course Coordinator.

Future User Role:

An HOD role may be considered as a future extension if the system is later expanded to include a formal review or approval stage after the Course Coordinator completes the Course File. This role is not considered part of the core functionality of the current version.

2.4 General Constraints, Assumptions and Dependencies

The proposed system will operate within the Course File structure and academic process followed by the institution. The following constraints, assumptions and dependencies have been considered while defining the requirements.

Constraints

- The system will depend on the Course File structure and categories defined by the institution.

- Users will only be able to access courses, sections and submissions for which they have the required permissions.
- The system will not independently determine whether the academic information provided by a faculty member is factually correct.
- AI-generated classifications, summaries and consolidated information may require human review.
- The accuracy of document processing may depend on the quality, structure and format of the submitted material.
- The core system will focus on Course File Management and will not replace existing institutional academic systems.

Assumptions

- A defined Course File format is available and can be represented within the system.
- The Course Coordinator has access to the common course-level information required for the Course File.
- Faculty members will submit relevant and authentic material under the appropriate Course File categories.
- Faculty members will have access to the courses or sections assigned to them.
- The Course Coordinator will review the processed information before the final Course File is generated.
- The required Course File categories can be defined in advance so that faculty members know where to submit their material.

Dependencies

The system will depend on:

- The Course File template and its defined requirements.
- A database for storing course, user and submission information.
- File storage for maintaining submitted documents.
- A suitable document-processing mechanism for reading supported files.
- An AI/LLM-based component for the planned document understanding and content consolidation functions.
- A document-generation mechanism for producing the final Course File.

2.5 Apportioning of the Requirements

The system will be developed in stages so that the basic Course File Management functionality can be established before the AI-assisted features are integrated.

The initial stage will focus on the foundation of the system, including user access, course and faculty management, predefined Course File categories and faculty document submission. This stage will establish the basic workflow through which faculty members can maintain their required material throughout the semester.

The next stage will focus on organizing and checking the submitted material. This will include tracking the completeness of submissions, associating submissions with the appropriate Course File sections and identifying potentially inappropriate or repeated information.

The following stage will introduce the AI-assisted component. The system will process the submitted material to assist with identifying relevant content, recognizing similar information from different faculty members and producing a consolidated version. The AI output will then be made available to the Course Coordinator for review and correction.

The final core stage will focus on bringing the reviewed information together into the final Course File and generating the required output.

Advanced features such as graphical summaries, detailed analytics and additional automated recommendations can be considered after the core workflow has been implemented and evaluated. These features will not take priority over the basic requirements of collecting, organizing, validating and consolidating Course File material

3. SPECIFIC REQUIREMENTS

This chapter defines the detailed requirements of the Course File Management System. The requirements describe how users will interact with the system, how faculty submissions will be managed, how the system will process and consolidate the submitted material, and what is expected from the database and overall system quality.

3.1 External Interface Requirements

The Course File Management System will be developed as a web-based application that can be accessed through commonly used web browsers, with Google Chrome being the primary expected browser.

The system will provide different interfaces according to the role of the user. The Administrator will use the system for managing users, courses, sections and faculty assignments. Faculty members will primarily use the system to access their assigned courses and submit the required Course File material. The Course Coordinator will have access to the submissions of the faculty members associated with the course and will manage the consolidation and finalization of the Course File.

The faculty interface will display the predefined Course File sections for which submissions are required. Faculty members will select the relevant section and upload the required document directly from their computer. The system will display the submission status of the relevant sections so that faculty members can keep track of their progress throughout the semester.

The system will primarily support document formats from which text and relevant information can be extracted. PDF and DOC/DOCX files will be supported as the main formats. Spreadsheet formats may also be supported where required by a particular Course File section. Image-only files and PowerPoint files will not be considered primary input formats.

After a document is uploaded, the system will check whether it is appropriate for the selected Course File section. If the submission does not correspond to the selected requirement, the system will display an appropriate message, such as "Invalid Submission", and the file will not be treated as a valid submission for that section.

Faculty members will be able to manage their submissions before the defined deadline. They will be able to edit, replace or delete submitted documents and maintain multiple versions where required. Once the

submission deadline defined by the Course Coordinator is reached, the submission will be locked. Further changes will not be allowed unless the Course Coordinator reopens the submission.

The Course Coordinator will be provided with an interface to view the submission status of different faculty members, access submitted documents and review the content processed by the system. The Coordinator will be able to review and edit the AI-generated consolidated content before the final Course File is generated.

The final output will be an editable Course File in the format finalized for the project. The output will contain the consolidated information generated from the faculty submissions rather than simply placing the original documents or paragraphs one after another.

3.2 Detailed Description of Functional Requirements

The functional requirements define the main operations that the system must support. They are grouped according to the responsibilities of the Administrator, Faculty and Course Coordinator, followed by the requirements related to AI-assisted processing.

3.2.1 Functional Requirements for Administrator

The Administrator will be responsible for the basic setup and maintenance of the application.

ID	Functional Requirement
FR-ADM-01	The system shall allow the Administrator to create user accounts for authorized users.
FR-ADM-02	The system shall allow the Administrator to assign appropriate roles to users.
FR-ADM-03	The system shall allow the Administrator to activate or deactivate user accounts.

FR-ADM-04	The system shall restrict users from accessing functions that are not permitted for their assigned role.
FR-ADM-05	The system shall allow the Administrator to create and manage courses.
FR-ADM-06	The system shall allow the Administrator to create and manage sections associated with a course.
FR-ADM-07	The system shall allow the Administrator to assign faculty members to their respective courses and sections.
FR-ADM-08	The system shall allow the appropriate authorized user to assign a Course Coordinator to a course.
FR-ADM-09	The system shall allow the Administrator to manage the basic configuration required for the Course File Management System.

3.2.2 Functional Requirements for Faculty

Faculty members will use the system to submit and manage the material associated with their assigned courses or sections.

Course and Section Access

ID	Functional Requirement
FR-FAC-01	The system shall display the courses and sections assigned to the logged-in faculty member.
FR-FAC-02	The system shall prevent a faculty member from submitting material for a course or section to which they have not been assigned.
FR-FAC-03	The system shall display the predefined Course File sections applicable to the faculty member's assigned course or section.
FR-FAC-04	The system shall display the submission status of the relevant Course File sections.

Document Submission

ID	Functional Requirement
FR-FAC-05	The system shall allow a faculty member to select a Course File section and upload the required document directly from their computer.
FR-FAC-06	The system shall associate each uploaded document with the faculty member, course, section, semester and selected Course File section.
FR-FAC-07	The system shall support PDF and DOC/DOCX as the primary document formats.
FR-FAC-08	The system may support spreadsheet formats for Course File sections where such files are required.
FR-FAC-09	The system shall reject unsupported file formats.
FR-FAC-10	The system shall provide confirmation when a valid document has been successfully submitted.

Submission Completeness and Validation

ID	Functional Requirement
FR-FAC-11	The system shall identify Sections 9–24 as mandatory submission sections and Section 25 as an optional section according to the current Course File structure.
FR-FAC-12	The system shall check whether the uploaded document is appropriate for the Course File section selected by the faculty member.
FR-FAC-13	If the uploaded document does not correspond to the selected section, the system shall display an invalid-submission message.
FR-FAC-14	The system shall not treat an invalid submission as a completed submission for that Course File section.
FR-FAC-15	The system shall allow the faculty member to upload a corrected document after an invalid submission.

Managing Submissions

ID	Functional Requirement
FR-FAC-16	The system shall allow faculty members to edit or replace a submitted document before the submission is locked.
FR-FAC-17	The system shall allow faculty members to delete a submitted document before the submission is locked.
FR-FAC-18	The system shall support multiple versions of a submission when a faculty member replaces or updates a previously submitted document.
FR-FAC-19	The system shall identify the latest version of a submission as the current version.

Submission Locking

ID	Functional Requirement
FR-FAC-20	The system shall allow the Course Coordinator to define the submission deadline or locking period.
FR-FAC-21	The system shall lock a faculty submission when the defined deadline is reached.
FR-FAC-22	The system shall prevent the faculty member from modifying a locked submission.
FR-FAC-23	The system shall display the locked status to the faculty member.
FR-FAC-24	The system shall allow the Course Coordinator to reopen a locked submission when a correction is required.

3.2.3 Functional Requirements for Course Coordinator

The Course Coordinator will manage the overall Course File and will be responsible for reviewing and consolidating the material submitted by different faculty members.

Course Information and Submission Monitoring

ID	Functional Requirement
FR-CC-01	The system shall allow the Course Coordinator to maintain common course-level information required for the Course File.
FR-CC-02	The system shall provide the Course Coordinator with an overview of submissions made by faculty members associated with the course.
FR-CC-03	The system shall allow the Course Coordinator to identify completed and pending mandatory submissions.
FR-CC-04	The system shall distinguish between mandatory and optional Course File sections.
FR-CC-05	The system shall allow the Course Coordinator to view documents submitted by individual faculty members.

Submission Review

ID	Functional Requirement
FR-CC-06	The system shall allow the Course Coordinator to review submissions that have been identified as invalid or requiring attention.
FR-CC-07	The system shall allow the Course Coordinator to view different versions of a submission where version history is available.
FR-CC-08	The system shall allow the Course Coordinator to reopen a locked submission when a correction is required.

AI-Assisted Content Processing

ID	Functional Requirement
FR-AI-01	The system shall process documents submitted under the same Course File section for consolidation.
FR-AI-02	The AI component shall extract relevant information from the submitted documents.
FR-AI-03	The AI component shall identify related or similar information provided by different faculty members.
FR-AI-04	The AI component shall reduce unnecessary repetition when multiple faculty members provide similar information.
FR-AI-05	The AI component shall generate a coherent consolidated version of the relevant information.
FR-AI-06	The AI-generated content shall be based on the information contained in the submitted documents.
FR-AI-07	The system shall allow the Course Coordinator to review the AI-generated content before it is included in the final Course File.

Course File Consolidation

ID	Functional Requirement
FR-CC-09	The system shall organize the processed information according to the predefined Course File structure.
FR-CC-10	The system shall combine relevant contributions from multiple faculty members associated with the same course.
FR-CC-11	The system shall avoid directly repeating similar information from multiple faculty submissions when the information can be meaningfully consolidated.
FR-CC-12	The system shall retain relevant differences between faculty submissions where those differences are necessary to represent the Course File accurately.

Review and Editing

ID	Functional Requirement
FR-CC-13	The Course Coordinator shall be able to review the consolidated content generated by the system.
FR-CC-14	The Course Coordinator shall be able to edit the consolidated content.
FR-CC-15	The Course Coordinator shall be able to accept or reject AI-generated consolidated content.
FR-CC-16	The system shall allow the Course Coordinator to manually add or modify information before finalization.

Final Course File

ID	Functional Requirement
FR-CC-17	The system shall allow the Course Coordinator to initiate final Course File generation after the required submissions have been reviewed.

FR-CC-18	The system shall combine the common course information with the reviewed and consolidated faculty submissions.
FR-CC-19	The system shall generate an editable final Course File in the output format selected for the project.
FR-CC-20	The final Course File shall contain consolidated information rather than simply reproducing the original faculty submissions.

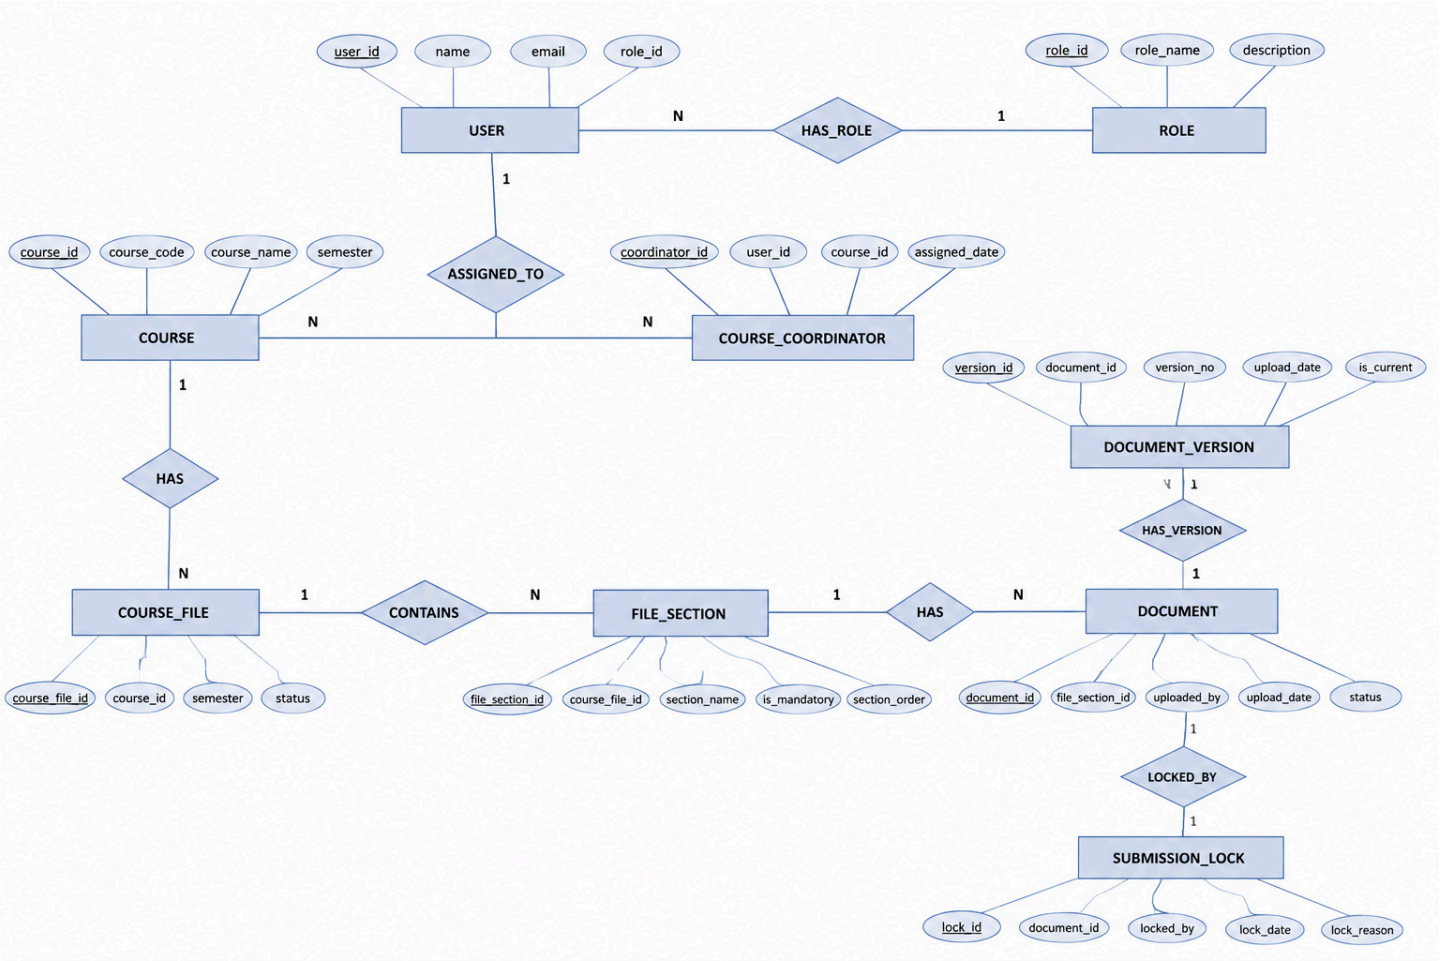

3.3 Performance Requirements

The system is expected to support the regular submission and management of Course File documents by multiple faculty members during an academic semester.

ID	Performance Requirement
PR-01	The system should provide an acceptable response time for normal operations such as opening a course, viewing submission status and navigating between Course File sections.
PR-02	The system shall provide clear confirmation after a document has been successfully uploaded, replaced or deleted.
PR-03	The system shall prevent loss or corruption of successfully submitted documents during normal system operation.
PR-04	The system should allow multiple faculty members associated with the same course to submit documents without interfering with one another's submissions.
PR-05	AI-based processing should be handled separately from normal website operations so that longer processing times do not make the rest of the system unavailable.
PR-06	The system should be capable of processing the number of documents normally expected for a Course File.

Exact numerical performance targets will be finalized after implementation and testing.

3.4 Logical Database Requirements

The system will require a database to maintain information about users, courses, faculty assignments, Course File sections and submitted documents.

The main entities expected to be maintained by the system are:

Entity	Information Maintained
User	User details, login information and assigned role
Course	Course identification and common course information
Section	Section details associated with a course
Faculty Assignment	Relationship between faculty, course and section
Course File	Course File associated with a course and semester
Course File Section	Predefined sections and their submission requirements
Document	Uploaded file and its associated information
Document Version	Previous and current versions of submitted documents
Submission	Submission status, dates and related information
AI Processing	Processed content and consolidated output
Course File Content	Reviewed content prepared for the final Course File

Each document shall be associated with the faculty member who submitted it, the relevant course and section, the semester and the selected Course File section.

The database shall maintain the status of each submission so that the system can determine whether a section is pending, submitted, invalid or locked.

Where multiple versions of a document are uploaded, the database shall maintain the relationship between the versions and identify the latest version as the active submission.

The system should also maintain a relationship between the original submissions and the consolidated content generated from them. This will allow the Course Coordinator to refer back to the source material when reviewing the AI-generated content.

Access to database information shall be controlled according to user roles. Faculty members shall only be able to access their permitted courses and submissions, while the Course Coordinator shall be able to access the relevant submissions for the course under their coordination.

3.5 Quality Attributes

Quality Attribute	Requirement
Usability	The system should provide a simple and clear interface so that faculty members can submit documents without requiring specialized technical knowledge.
Security	The system shall restrict access to users according to their assigned roles and course responsibilities.
Reliability	Successfully submitted documents and associated information should not be lost during normal system operation.
AI Accuracy	The AI component should generate consolidated content that accurately represents the information contained in the submitted documents.
AI Transparency	AI-generated content should be presented for review rather than being treated as automatically final.
Maintainability	The system should allow Course File categories and submission requirements to be modified if the institutional template changes.
Scalability	The system should support multiple courses, sections and faculty members within the expected institutional environment.

Privacy	Course-related documents and faculty submissions should only be accessible to authorized users.
Consistency	Submissions should follow a common Course File structure so that information from different faculty members can be processed and consolidated consistently.

3.6 Other Requirements

The system should maintain a clear relationship between the documents submitted by faculty members and the final consolidated Course File. This is important because the final content may be generated with the assistance of the AI component and subsequently edited by the Course Coordinator.

The system should retain sufficient information to identify the source documents used during the consolidation process. This will allow the Course Coordinator to refer to the original submissions whenever clarification or verification is required.

The system should provide clear status information throughout the submission process. Faculty members should be able to determine whether their submissions are pending, successfully submitted, invalid or locked. The Course Coordinator should be able to view the overall completion status of the Course File.

The Course Coordinator shall remain responsible for the final content of the Course File. AI-assisted processing is intended to reduce the manual effort involved in reviewing and consolidating multiple faculty submissions and shall not replace the Coordinator's academic judgement.

The final output shall remain editable so that the Course Coordinator can make necessary corrections before the Course File is submitted through the institutional process.

The exact output format and technical approach used for the AI component will be finalized during the design and implementation stages based on the project requirements and available technologies.

.

4. Document Approvers

The Software Requirements Specification (SRS) document for the Course File Management has been reviewed and approved by the following:

Name	Designation
Ashwika	Team Member 1
Divisha	Team Member 2
Bhavya	Team Member 3
Gyanesh	Team Member 4
Dr. Shilpa Mahajan	Course Coordinator

Approval Statement

This document has been reviewed for completeness, consistency, and correctness. The undersigned members agree that the requirements specified in this Software Requirements Specification accurately represent the intended functionality and scope of the Course File Management.
